

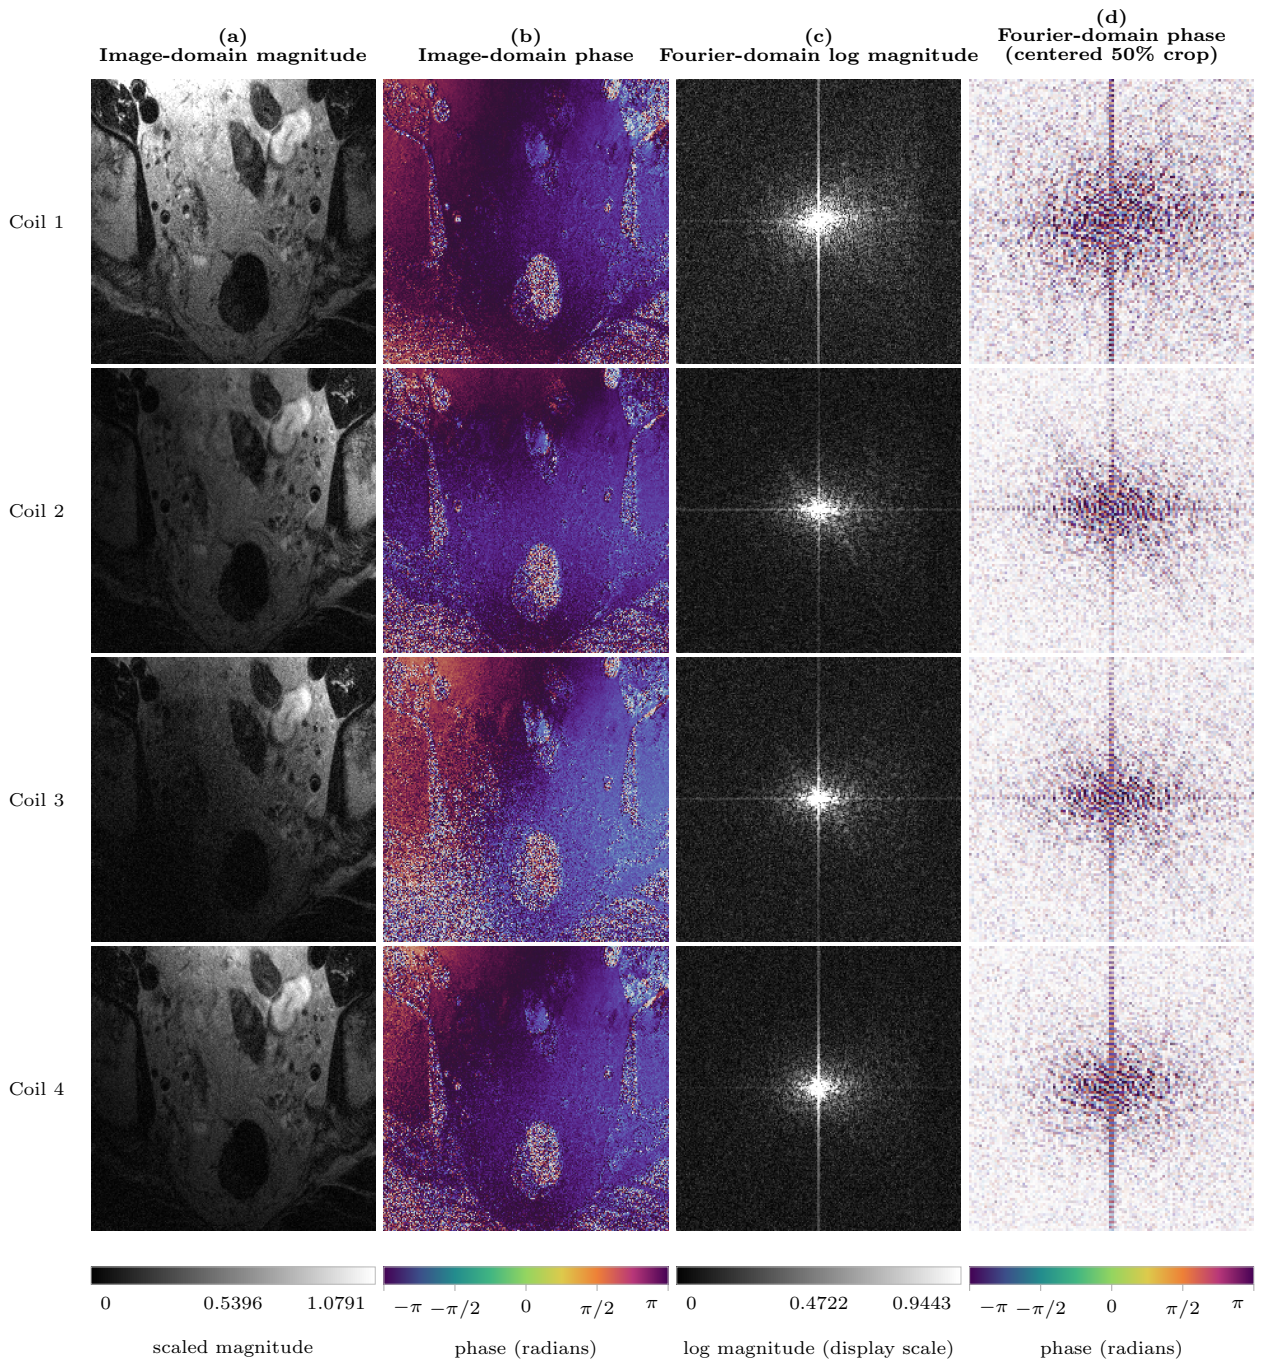

Figure 1. Representative prepared T2-weighted slice showing the four selected receiver coils after phase alignment and shared robust scaling. Phase hue denotes angle on a cyclic $[-\pi, \pi]$ scale. Image-domain phase is shown at near-full opacity within the foreground support, whereas Fourier phase uses magnitude-weighted opacity and a centered 50% crop of k-space; the Fourier log magnitude remains full-frame. These visualization choices do not change the model input, which uses the centered orthonormal FFT and shared robust scaling from the experimental pipeline.
